What are some of the cybersecurity measures we’re working on?

Incident response: Rapid response team to quickly understand events, coordinate activity and communication, ensure liaison with executives and external law enforcement.

Scanning of systems for common vulnerabilities: We are constantly being scanned by people on the Internet. Why can’t we turn this to our advantage?

Training: Ultimately, without good technical staff, all of the other software, hardware and security services we might put in place is meaningless.

Policies: Privacy versus security; security of Internet-based payments; personal, incidental use; and more.

Collaboration: Security is a hard problem. Working with colleagues across UC and in other organizations is key.

Products and services: Early notification services and layered antiviral defenses are just the beginning.
